

method

- I want every datapoint to be referenced / sourced
- I want every piece of code necessary to produce the artifact to be published
- meaning, including automatic datafetching of the source data if possible
- and including every calculation necessary to produce the output from the input
- I want **extremely** clear differentiation between what is
 - verified, external data
 - produced in a verifiable way as part of the project
 - **assumed** by the project to make the calculation possible
- and I would love it if the artifact like the pdf was verifiable / hashed as well.

example content - city populations

ok, the numbers are slightly wrong because wikidata is annoying. ACTUALLY It's even better with a mistake, because that way you can go there, follow the source and find the mistake. the problem is that wikidata population numbers are actually a time series and there is no default sorting putting the newest at the top.

sources

data

wikidata

- Paris <https://www.wikidata.org/wiki/Q90>
- London <https://www.wikidata.org/wiki/Q84>
- Berlin <https://www.wikidata.org/wiki/Q64>
- New York <https://www.wikidata.org/wiki/Q60>
- Buenos Aires <https://www.wikidata.org/wiki/Q1486>

code

the calculations.py in this repo

dependencies

python

self written wikidata fetching module <https://github.com/bmaxv/simplewikidata>
